Effect of tidal hour on the abundance of penaeid shrimp postlarvae (Decapoda, Penaeidae) along the Mexican Pacific coast

Authors: José A. Félix-Ortiz¹; E. Alberto Aragón-Noriega²; Nicolás Castañeda-Lomas³; Guillermo Rodríguez-Domínguez³; Wenceslao Valenzuela-Quiñónez⁴ and Manuel E. Siu-Quevedo⁵

Source: Crustaceana, Volume 90, Issue 2, pages 167 – 176

Publication Year : 2017

DOI: [10.1163/15685403-00003635](https://doi.org/10.1163/15685403-00003635)

ISSN: 0011-216x **E-ISSN:** 1568-5403

Document Type: Research Article

Subjects: Biology

Keywords: Abundance; Abundance; postlarvae; tidal hour; shoreline zone; postlarvas; hora mareal; zona litoral

Brill's MyBook program is exclusively available on BrillOnline Books and Journals. Students and scholars affiliated with an institution that has purchased a Brill E-Book on the BrillOnline platform automatically have access to the MyBook option for the title(s) acquired by the Library. Brill MyBook is a print-on-demand paperback copy which is sold at a favorably uniform low price.

In the present study we explored the effect of the tidal hour on the postlarvae abundance of the penaeid white-leg shrimp (*Litopenaeus vannamei* (Boone, 1931)) in three Mexican Pacific coastal lagoons. Correlation analysis of tidal hour against the hourly variation of the abundance of postlarvae was conducted in three regions of the Mexican Pacific; the system lagoon Huizache-Caimanero LHC, the region of the "Grandes Lagunas" SGL and the "Mar Muerto" Lagoon LMM. Two peaks were found in *L. vannamei* abundance in the three locations, at 04:00 and 16:00 of tidal hour in LHC and SGL, and 06:00 and 12:00 of tidal hour in LMM. Significant correlations between postlarvae and the tidal hour for the three regions were found. The tidal hour standardizes the time of ebb and flow. It is concluded that tidal hour can be used as cue for shrimp postlarvae immigration to nurseries.
